

Topic: The main idea of the website is a birthday website which allows the user to store all their friends/family birthdays. The user will also be able to write a happy birthday message, as well as view everyone's birthday/info.

Audience: The audience for this website is really for anyone who wants an organized place for their birthday information, since it is sometimes hard to remember everyone's birthday and what they like. This would help create a storage space for all that information.

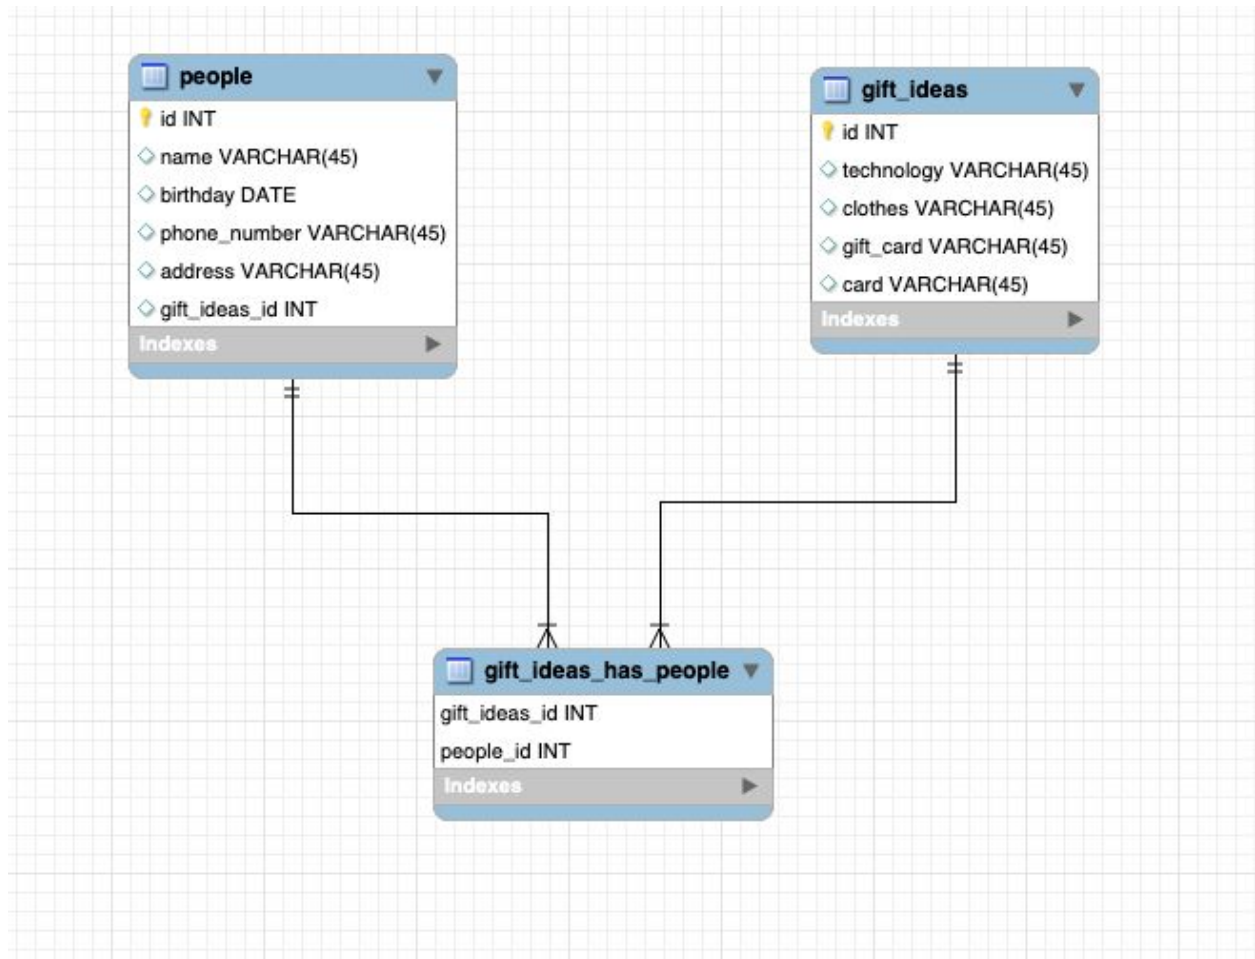

Design/Style: I was thinking about having a light color scheme. Colors such as light blue, white, pink are some of the colors I'm considering. Any color that's usually associated with birthdays balloons are also in the mix.

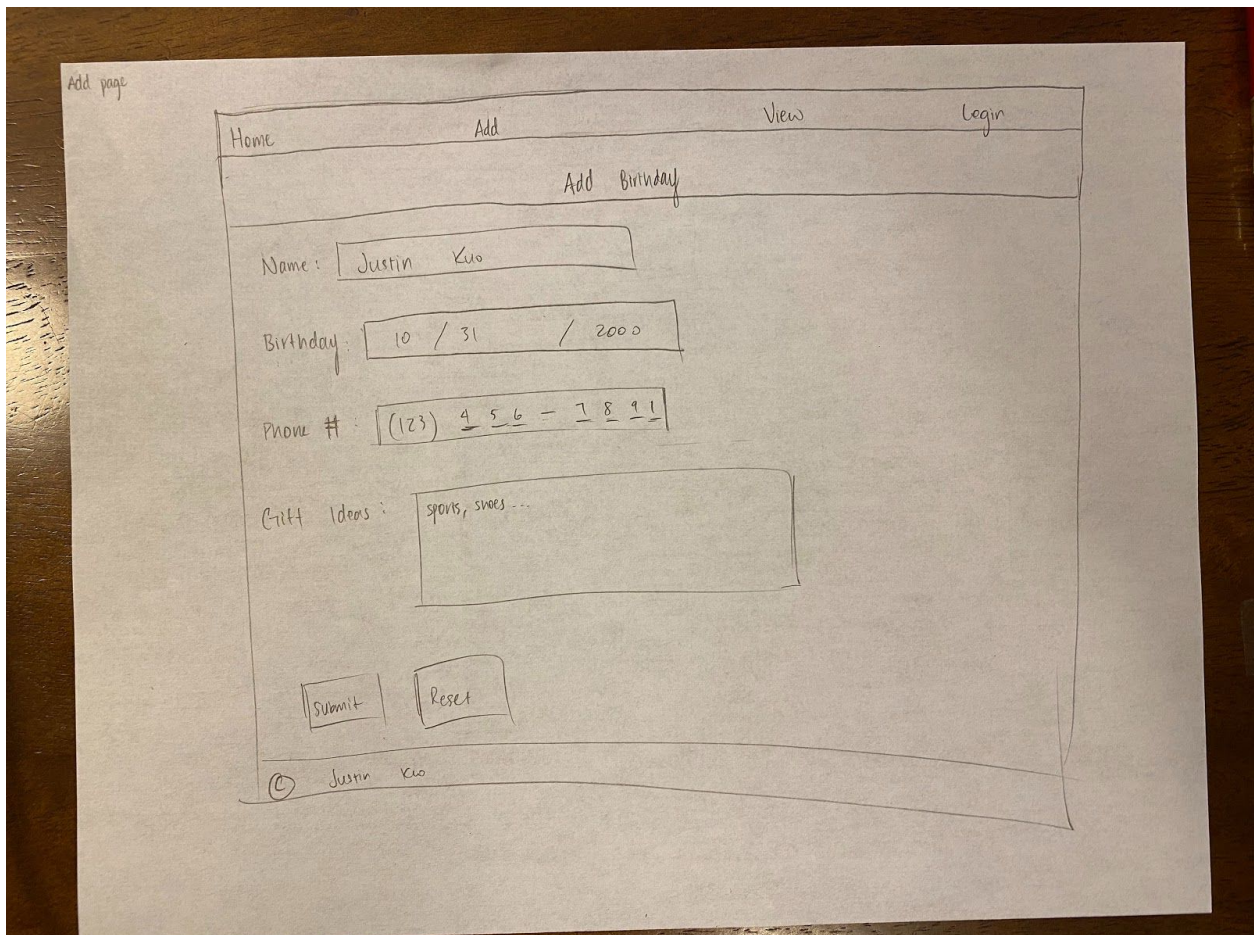

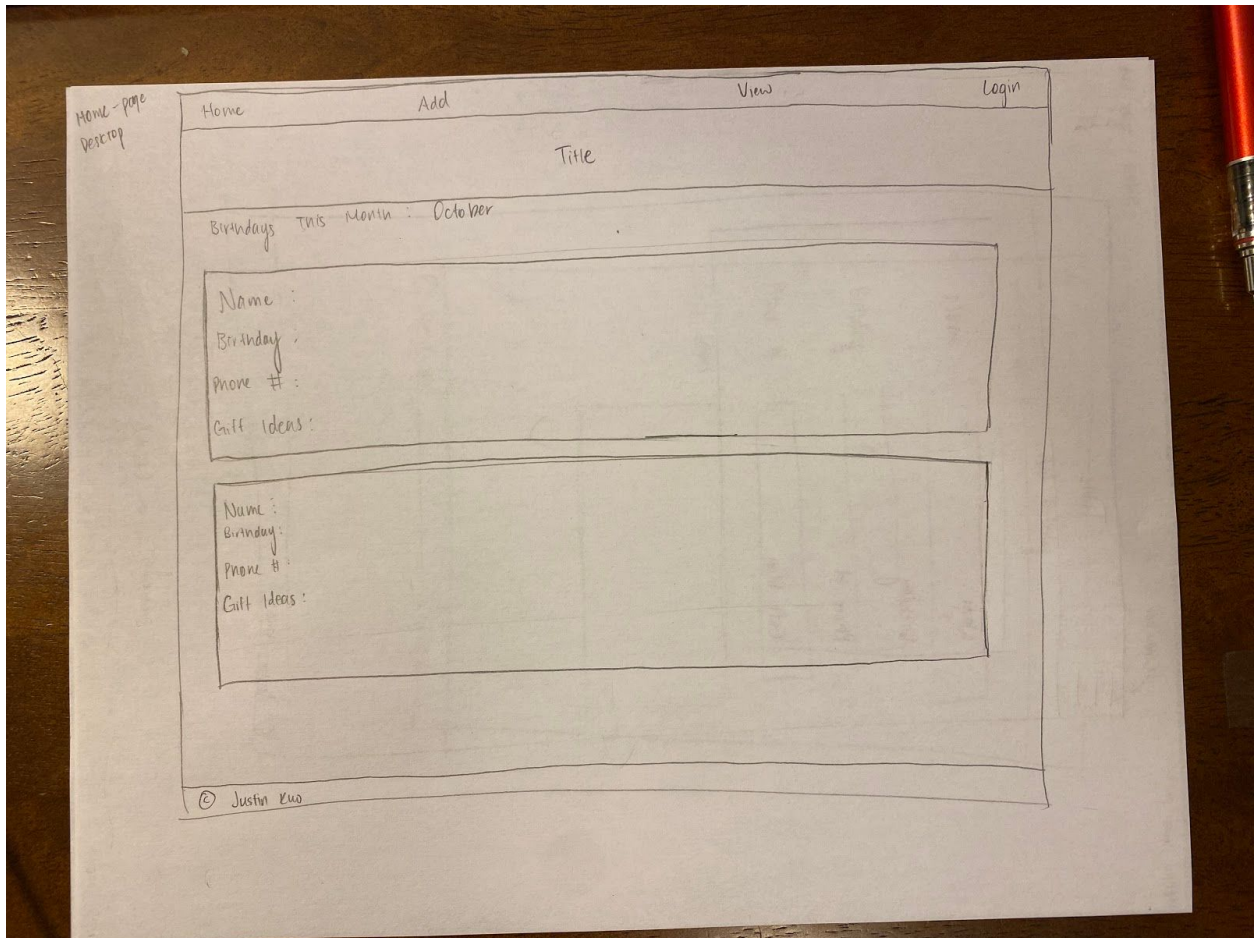

These are just a few schemes that I like for the site.

Scope: I'm planning on having four pages. The home page, where it will display any birthday's within the month. Another page will be the login page, where the user is able to log in and view the records. An add birthday page, where the user adds all the information they like. Lastly, there will be a view page, where it displays all the birthdays and info nicely to the user.

Database: The data will come from the user mainly. The data that will be stored are names, birthday, phone numbers, home address, email addresses, potential gift ideas.
